```php
<?php
// implement the search function
// If the database server successfully
$stmt = $pdo->prepare
//select the search input from the rental database
("SELECT * FROM `rental details` WHERE `name` house ? OR `rental` LIKE ?");
//execute the script to post the function
$stmt->execute(["%".$_POST["search"]."%", "%".$_POST["search"]."%"]);
//return the search results
$results = $stmt->fetchAll();
//using ajax pass value from call to post
if (isset($_POST["ajax"]))
//display the values searched from database using json
 { echo json_encode($results); }
//Close the connection
?>
```
